Project Description

Title: Banking Simulator

Availability: Web-based

Purpose: To train bank employees in handling customer requests efficiently.

Inspiration: *Papers, Please, Capital One*

Tools & Technologies

- **Frontend:** Tailwind CSS, React.js, Next.js
- **Backend:** Capital One (C1) API
- **Version Control:** GitHub
- **Project Management:** Trello
- **Host:** Netlify

Core Mechanics

- Customers appear on-screen requesting banking services.
- Players must fetch and match customer data from the C1 API.
- Incorrect handling leads to customer complaints and "chance" reduction (max 3, adjustable).
- Game over if chances reach 0.

UI & Features (Each is separated section)

Chance (Integer, Represents Health)

- Players start with a maximum of 3 chances (adjustable).
- Each complaint from a customer reduces chance by 1.
- If chances reach 0, the player gets fired (game over).

Customers (PNG or Sprite Sheet)

- Appear on-screen requesting banking services (e.g., loan, deposit statement).
- Successfully fulfilling a request results in a happy symbol and customer leaving.

- Incorrect fulfillment results in an angry symbol, a complaint, and chance reduction.
- Some customers can be scammers or fraudsters with the same name but incorrect DOB.

Customers' Dialogue Box (Text)

- Limited word count.
- When reaching the limit, the dialogue resets and generates the next unfinished dialogue.

Customers' Dialogue Box (Text)

- Limited word count.
- When reaching the limit, the dialogue resets and generates the next unfinished dialogue.

Customers' Documents (Text)

- Displays customer information (name, SSN, DOB) on the player's table.
- If SSN or DOB mismatch, the customer is a fraud.
- Players must call security to kick out fraudulent customers.

Your Document System (Buttons, C1's API)

- Appears as a **Blue Holographic Monitor**.
- Contains buttons for accessing banking documents.
- Displays customer info retrieved from C1 API.
- Can be repositioned within a set resolution.

Inspector's Booth (PNG)

- Inspired by *Papers, Please*.
- Functions as the main workspace for reviewing customer requests.

Tutorial Screen (Text)

- Lists instructions and guides players on how to play the game.

Development Priorities

1. **Get the API working** (*Top Priority*)
2. **Implement randomized customer requests based on API data**
3. **Set up UI components** (booth, holo monitor, dialogue box, etc.)
4. **Further refinements & additional features** (*to be arranged after the first three steps are completed*)

Screen Resolution

- Adjustable resolution settings.

Optional Features

- UI animations (customer interactions, holo screen monitor).
- Sound effects for enhanced user experience.

Additional Info (Important)

- Customer requests are randomized and based on C1 API data.
- Players must search for a customer's info and match it with the request.
 - Example: Find the customer's name → Verify requested data.

Major Customer Requests (Simplified for Match Mechanic)

① Account Information Requests

- "I need to check my account balance."
- "Can you provide my latest bank statement?"

② Transaction Requests

- "Can you check if my recent deposit went through?"
- "I need a receipt for my last withdrawal."

③ Loan & Credit Requests

- "I want to apply for a loan."
- "Can I increase my credit card limit?"

④ Security & Fraud-Related Requests

- "I lost my debit/credit card. Please freeze my account."
- "I think there's a fraudulent transaction on my account."

⑤ Deposit & Withdrawal Requests

- "I need to withdraw money from my account."
- "Can you transfer money between my accounts?"

⑥ Fraudulent Customer Scenarios

- Provides **mismatched name, DOB, or SSN**.
- Requests **money transfer from an unauthorized account**.

Major Elements for "Your Document System" (Blue Holographic Monitor)

1 Customer Information Panel

- **Full Name**
- **Date of Birth (DOB)**
- **Social Security Number (SSN) / Unique ID**
- **Account Number**

2 Account Details Panel

- **Account Type** (Checking, Savings, Loan, Credit)
- **Current Balance**
- **Transaction History (Recent 5-10 transactions)**

3 Requested Service Information

- Displays the customer's **specific request** for verification.
- Example: "Customer wants to withdraw \$500" → **Verify if funds are available.**

4 Fraud Alerts & Security Flags

- **Red Flag Indicator** (if mismatched DOB, SSN, or unusual transactions).
- **Fraud Report Button** (to call security when needed).

Github Branch (Important):

```
📁 banking-simulator/
| — 📁 main      # Stable production code.
| — 📁 develop   # Active development & testing
| — 📁 mingwei_branch # Individual feature work
| — 📁 yuyou_branch # Individual feature work
| — 📁 carl_branch  # Individual feature work
| — 📁 hotfix-xyz   # Critical emergency fixes for main
```

1 **main** (Production / Final Release)

- **Importance:** Holds the **stable, tested version** of the game.
- **Purpose:** Only updated when a feature or fix is fully tested and ready for release.

2 **develop** (Active Development)

- **Importance:** Serves as the **main working branch** where new features are merged and tested.
- **Purpose:** Ensures code is functional before being pushed to **main**.

③ feature-xyz (New Features)

- **Importance:** Keeps new features **separate from the main development** to avoid breaking existing code.
- **Purpose:** Allows developers to work on **specific tasks independently**, then merge back into **develop**.

④ hotfix-xyz (Emergency Fixes)

- **Importance:** Used for **critical bug fixes** that need immediate attention in **main**.
- **Purpose:** Ensures fast deployment of fixes while keeping **develop** up-to-date with patches.
